

* X_{ij} son valores continuos positivos

* cada s_i (oferta del nodo i) es igual a 15hrs máximo

* cada d_j (demanda del nodo j) es 7, 8 o 15hrs

* cada c_{ij} (preferencia del ay_i a la ay_j) es

$-M, 1, 2, 3, \dots, 10$ con M un número "grande"

* para tener soluciones factibles exigimos que $u \geq u$, así nos aseguramos que se cumpla la demanda

s_i : oferta de horas del estudiante i

d_j : demanda de horas de la ayudantía j

c_{ij} : preferencia del est. i a la ayudantía j

En general:

$$FO: \quad z = \sum_{\substack{1 \leq i \leq m \\ 1 \leq j \leq n}} c_{ij} \cdot x_{ij}, \quad x_{ij} \in \mathbb{R}^+ \quad \left. \vphantom{\sum} \right\} \text{maximizar}$$

Const:

$$\left. \begin{array}{l|l} \text{const } 1 & \text{oferta } 1 \\ \vdots & \vdots \\ \text{const } m & \text{oferta } m \\ \vdots & \vdots \\ \text{const } m+1 & \text{demanda } 1 \\ \vdots & \vdots \\ \text{const } m+n & \text{demanda } n \end{array} \right\} \begin{array}{l} x_{11} + x_{12} + \dots + x_{1n} \leq 15 \\ \vdots \\ x_{m1} + x_{m2} + \dots + x_{mn} \leq 15 \\ \\ x_{11} + x_{21} + \dots + x_{m1} = 7, 8, 15 \\ \vdots \\ x_{1n} + x_{2n} + \dots + x_{mn} = 7, 8, 15 \end{array}$$

Usando LINDO:

$$\left. \begin{array}{l} \text{max } z \\ \text{s.t.} \\ \text{const } 1 \\ \vdots \\ \text{const } m \\ \text{const } m+1 \\ \vdots \\ \text{const } m+n \\ \text{end} \end{array} \right\} \begin{array}{l} \text{ofertas} \\ \text{demandas} \end{array} \quad \left. \vphantom{\begin{array}{l} \text{const } 1 \\ \vdots \\ \text{const } m+n \end{array}} \right\} \begin{array}{l} \text{Escribir esto con} \\ \text{Python} \end{array}$$

fo: $\max z = 5x_{11} + 9x_{12} + 8x_{22} + 6x_{31} + 7x_{33} + 10x_{13}$

en general $z = \sum_{\substack{1 \leq i \leq m \\ 1 \leq j \leq n}} p_{ij} \cdot x_{ij}$

sujeto a:

oferta

$$\begin{cases} x_{11} + x_{12} + x_{13} \leq 15 \\ x_{22} \leq 15 \\ x_{31} + x_{33} \leq 15 \end{cases}$$

nodes.
